VSD 5.4 Release Notes

Overview

Visual Statistics Display (VSD) version 5.4 is a new release of the VSD product.

This version of VSD, like previous versions, supports statmonitor files generated from:

- ▶ All versions of GemStone/S 64 Bit™
- ▶ All versions of 32-bit GemStone/S
- ▶ All versions of GemBuilder™ for Smalltalk (GBS)

Supported Platforms

VSD version 5.4 is verified and supported on the following platforms:

- ▶ Windows 7, Windows 2008 R2, Windows 8, Windows 10, and Windows 2012
- ▶ Solaris 10 and 11 on SPARC
- ▶ Solaris 10 on x86
- ▶ AIX 6.1 and AIX 7.1
- ▶ Red Hat Linux ES 6.4, 6.5, 6.7, 6.9, 7.1, and 7.4; Ubuntu 14.04 and 16.04; SUSE Linux Enterprise 12, on x86
- ▶ OS X 10.11.2 (El Capitan) with Darwin 15.2.0 kernel, and OS X 10.12.6 (Sierra), with Darwin 16.7.0 kernel, on x86

Note that 32-bit VSD executables are deprecated in v5.4.

Changes in this release

Version of Tcl/Tk updated

The version of Tcl/Tk used by VSD has been updated to 8.6.8.

Configuring location of startup files

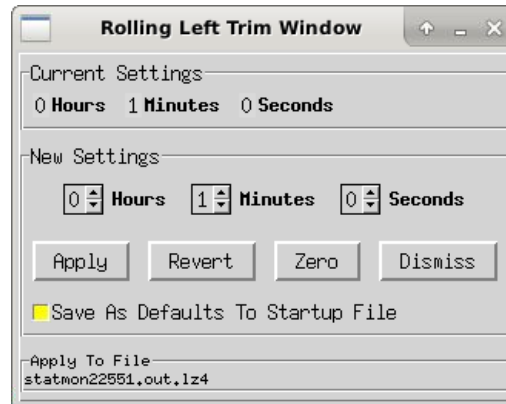

VSD normally looks for `.vsdconfig`, `.vsdrc`, and `.vsdtemplates` in the home directory of the user executing `vsd`. Previously, this was not configurable; now, setting the environment variable `$VSDHOME` on Unix, or `%VSDHOME%` on Windows, causes VSD to look for and read, or create, these files in another directory.

If this directory is set in the environment in which VSD is started, and provided it is a valid directory, VSD will use that location instead of the home directory. If this environment variable is not defined or not a directory, VSD will continue to use the home directory.

Auto-updated rolling time window

When using the VSD auto update feature to continuously monitor a running system, details of the recent statistics become compressed and difficult to read as the monitoring session becomes long. The existing ability to zoom is not useful since as new statistics are added the zoomed section no longer shows the most recent records.

A new feature has been added to allow monitoring over a rolling time window, specified as a duration of hours, minutes, and seconds before the timestamp of the most recent record. With this configured, charts will display the most recent statistics for that duration, trimming off the left-hand (earlier) statistics in the chart. As manual or automatic updates add new statistics on the right, older ones will be trimmed on the left.

The keyboard shortcut `Ctrl-R` brings up this dialog from the Main Window.

Rolling left trim, like auto update, applies to the current file, and is specifically intended for the file created by **Main > Monitor...**. The current file is shown at the top of the Main window, in the field labeled **File:**. The name of the current file is displayed at the bottom of the dialog.

Using **Apply** updates the graphs for all open Chart Windows on statistics in the given file.

Managing Fonts

VSD now has the ability to set the fonts for the Main Window, as well as the fonts for the Chart Window, Data Log, and Help Text. These are now set using platform native Font selection UI.

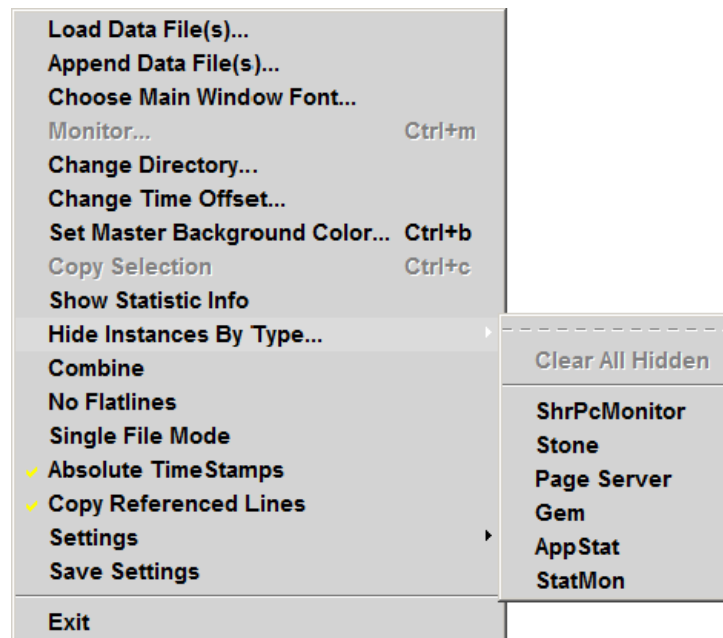

The font for the main Window, which also sets the label and menu fonts for other windows, is set using the Main Window menu item **Main > Choose Main Font...**

The **Chart** menu Item **Choose Chart Font...** now includes options to get the Chart Window font and the data log font.

Hiding specific process types in the process list

You may now hide specific process types in the process list. For example, you may wish to not see the statistics associated with page servers or statmonitor itself.

A menu item as been added, **Main > Hide Instance By Type...**, which provides a list of process types that can be hidden.

Note that this setting is not saved to the .vsdrc, since applying this filter on a much later restart of VSD may unexpectedly conceal processes.

"Preferences" has been renamed to Settings, and Confirm Exit moved

The Main Window Main menu **Preferences** has been renamed to **Settings**, and the **Confirm Exit** menu item is now on this sub-menu.

"Elapsed Time In Seconds" has been renamed to "Seconds"

This menu item is on the Main Window **Chart > Time Format** and Chart Window **Chart > Time Format** submenus. The previous name was incorrect when in Absolute Timestamps mode.

Keyboard shortcuts to enable or disable auto update

With **File > Auto Update** enabled, VSD continuously monitors the loaded statmonitor file for added entries, and reads and updates the display with new information.

The shortcut shift-control-A now can be used to toggle Auto Update.

VSD recording further configuration information

Many configuration details are recorded in `.vsdrc`, and will be applied when VSD is next started with that `.vsdrc`. Some details in what has recorded have changed, such as the file filter (e.g. all files or only statmonitor files) in the Open Statmonitor File dialog. Other minor missing details are now recorded, and the entries in `.vsdrc` are now sorted.

VSD command line specification for a directory

VSD now accepts a single directory on the command line, in addition to one or more statmonitor file names.

If a directory is included on the command line, VSD uses that directory as its working directory, and after startup, opens the Open Statmonitor File dialog on this directory.

Aliases for statistic names

Both GemTalk Engineering and Customer applications make use of session statistics, which can be set programmatically in GemStone Smalltalk or in C code. Session statistics are recorded by Statmonitor and displayed in VSD for Gems as `SessionStat00...SessionStat47`. In addition, applications can update global statistics, reported in VSD for Stones as `GlobalStat00..GlobalStat47`.

To make analysis of the process-specific uses of these statistics easier, you may now add custom aliases, to associate the statistics with meaningful names and descriptions. Aliases appear in parenthesis after the statistic name.

The VSD distribution also includes alias templates for common GemStone server maintenance operations, such as `backup` and `markForCollection`.

Adding aliases is not limited to session statistics; any Gem or Stone statistic name may be associated with an alias for a particular process pattern. Statistics aliases are not applied for processes other than Gems or Stones.

Process-specific appended alias names

A custom statistics alias associates an alias name, description, and other details that VSD uses for display, with an existing statistic name. This association is set by a name pattern for the process (and, optionally, by GemStone version).

The aliases are defined via commands that are included in a VSD support file, either `.vsdconfig` or `.vsdrc`. To update an alias, you must shut down VSD, edit the file, and restart.

The `setCtrAlias` command has the following arguments:

```
setCtrAlias CacheNamePattern StatName Alias Type Filter Units Description
           [versionPatterns [writeToStartupFile]]
```

where the arguments are:

CacheNamePattern - cache name of processes to match, case sensitive.

StatName - name of an existing cache statistic

Alias - name of the alias

Type - one of counter, counter64, uvalue, uvalue64, svalue, svalue64.

Filter - one of none, persecond or persample.

Units - Unit of measure for the statistic.

Description - A brief description of the statistic.

versionPatterns (optional) - * for all GemStone versions, or a list of GemStone version numbers that the alias applies to. This is primarily intended for the system aliases described starting on page 8.

writeToStartupFile (optional) - Boolean (1 or 0) indicating if the alias will be written to `.vsdrc`. 1 means write the alias definition to `.vsdrc`, 0 means do not write to `.vsdrc`.

For example, if you have a process that acts as a watchdog to kill misbehaving sessions, your code can programmatically update session stat 0 with the number of sessions killed. To view the statistics in VSD, you can add the alias 'NumSessionsKilled' to SessionStat00.

Defining the following alias in `.vsdrc`:

```
setCtrAlias WatchDog SessionStat00 NumSessionsKilled counter64
           none {The number of sessions killed} * 1
```

In VSD, when you load the `statmonitor` file or `monitor`, it will display the statistic name for the WatchDog process as:

```
SessionStat00 (NumSessionsKilled)
```

The Statistics Information window will provide the description.

Process name matching can include a *, which will match any portion of a string or nothing. However, use the * with caution, since process names with or without a * are treated as unique patterns, and only the one that appears first will be used. Once a process name is matched to WatchDog, WatchDog*, or *, other potential matches to the process name are ignored, and the statistics will not be applied.

Managing aliases in VSD support files

VSD has two files that specify VSD settings such as window sizes, options, and aliases. These files are `.vsdconfig` and `.vsdrc`.

When VSD starts up, it looks for `.vsdconfig`. If this file does not exist, it creates a default one; if it does exist, all the settings will be used. VSD also looks for the file `.vsdrc`, and any settings in that file will override settings in `.vsdconfig`.

On shutdown, if **Settings > Save Settings On Exit** is true (`set vsd(autoSaveConfig 0)`), then `.vsdrc` is written out based on the current settings in VSD; this includes both ones that were read from file and any changes made while using VSD.

Note that these `.vsdconfig` and `.vsdrc` files are persistent and used by any version of VSD that you run; any version of VSD is intended to use any version's `.vsdconfig` and `.vsdrc`. As of version 5.4, the location of these files can be configured (described on page 4); previously all versions of VSD read from or created these files in the user's home directory.

You may define statistics alias in either `.vsdconfig` or `.vsdrc`. If the alias is defined in `.vsdconfig` with `writeToStartupFile` as 0 (false) or if **Save Settings On Exit** is false, then the alias definition will not be written to `.vsdrc`, but will be read from `.vsdconfig`.

If you wish to add aliases to `.vsdrc`, either `writeToStartupFile` must be true, or **Save Settings On Exit** must be false, otherwise the definition will be lost after shutdown.

Alias templates for system operations statistics

The code that implements important GemStone operations such as `reclaim` and `markForCollection` collect a number of session statistics, to provide additional information for GemTalk Engineering analysis. These are undocumented, and many of them are obscure in the absence of source code. However, there are some that may be useful or suggestive when analyzing problems or performance issues.

VSD now includes an additional file, `vsd.internal.stat.aliases.tcl`, which contains aliases for the session statistics internally produced by GemStone operations. These are defined per GemStone version, and the statistics definition for each process in specific versions are provided, in addition to the alias names.

Note that since internal session statistics are not a supported or documented feature, there may be inaccuracies or version-specific differences that VSD does not detect.

Version 3.2 and later:

- ▶ Reclaim and Admin Gem
- ▶ `markForCollection`
- ▶ `fullBackup` and `restoreFromBackup`
- ▶ page and object Audit
- ▶ `cacheWarming`
- ▶ `logsender` and `logreceiver`

Version 2.4.x:

- ▶ PageManager
- ▶ Reclaim and Admin Gem
- ▶ `markForCollection` and Fast FDC
- ▶ `cacheWarming`

32-Bit GemStone/S:

- ▶ PageManager
- ▶ GcGems, Reclaim and Epoch
- ▶ `markForCollection`

Applying internal operation alias templates to application Gems

Aliases work by matching the pattern of the Gem name in the `statmonitor` data file. For example, the `ReclaimGem` has a name like `GcReclaim6`. Internal session statistics aliases are automatically applied to processes with names that follow this pattern.

However, processes such as `markForCollection` and `restoreFromBackup` are executed by ordinary Gems, which by default have the cache name `GemN` or `Topaz`. If you know the session that ran the given operation, you can apply the alias by name.

To do this, in the Main window, select the session, and use the right menu button pop up menu. **Apply Alias Template For Type >** provides a list of templates that you can select from to apply to the selected Gem process.

You may also set the cache name to exactly match the template definition, as listed in the submenu under **Apply Alias Template For Type**. For example, for an MFC session, execute:

```
System cacheName: 'MarkForCollection'.
```

And the MarkForCollection template will be automatically applied when the statmonitor file is loaded.

Removing Aliases

The Main Window process pane pop up menu item Remove Aliases is enabled if the process has an alias, either a custom alias from .vsdconfig or .vsdrc, or an applied system alias. Using the Remove Aliases removes either type of alias.

Removing custom aliases does not affect writing these alias to .vsdrc on shutdown; removes in this way are transient.

A system alias can be reapplied using the **Apply Alias Template For Type** menu. You cannot reapply custom alias; you will need to restart VSD to retrieve these aliases.

Existing undocumented statistics rename feature

VSD has had an existing but undocumented feature to rename statistics globally. This is done by including, in .vsdconfig or .vsdrc, lines similar to the following:

```
sl_stat -alias existingStatName newName
```

This causes all statistics named *existingStatName* to be replaced by *newName* wherever it is used. *newName* should not be an existing statistic name.

Bugs Fixed

VSD crash on Windows with command line argument of an invalid file

On Windows, if starting VSD with a command line argument and the argument did not specify a file in the current directory, VSD would crash.

VSD crash on negative time offset

When the Change Time Offset was set to a negative value, VSD would crash. (#46787)

Time offset applied when using relative timestamps

When using relative timestamps (Absolute Timestamps not enabled), Chart Windows labels are the time offset from the first record, which is 0. A time offset was inappropriately applied, making the charts difficult to read. (#46237)

Horizontal scroll bar in file drop-down obscured text

When multiple files are loaded, selection of a file is via a drop down near the top of the Main windows. If the filename was long, the horizontal scrollbar would obscure the text, making selection difficult. (#47660)

File load not responsive to interrupt

when loading a very large statmonitor file, and the interrupt button is pressed, it took an unreasonably long time for the load to be stopped. More callbacks have been added to improve responsiveness. (#44709)

File handling for lz4 files

Under some circumstances, the lz4 file handling code can attempt to close a file descriptor twice, which causes VSD to crash. One known case is when the a non-lz4-formatted file has an .lz4 extension. (#46249)

The errors that are reported when a file cannot be opened have also been improved.
